

 **Celigo**[®] Image Cytometry

Every Cell. Every Well.

Product Guide

Celigo Image Cytometer

The bench-top Celigo image cytometry system provides high-throughput, whole-well imaging and quantitative data through image analysis in bright field and up to four fluorescent channels, for a wide variety of cell-based assays. It is routinely used to investigate adherent and suspension cells, 3D tumor spheroids and colonies of iPSC and cancer stem cells. It is compatible with microwell plates from 6 to 1536-well and T-flask formats.

The work-flow based intuitive software provides concurrent imaging and analysis; kinetic analysis such as time-lapse growth tracking, flow cytometry-like gating analysis and reporting of cell populations. Cell images of specific populations may be displayed with color overlays.

The Celigo product allows users to perform high-speed, fully automated imaging and quantification of a wide range of cell types across complex sample types. It enables an extensive menu of applications including label-free cell counting, confluence-based cell growth tracking, killing assays, apoptosis, cell cycle analysis, migration and invasion assays, as well as cellular assays for receptor internalization, protein expression and detection, phosphorylation and phagocytosis.

Core Technology

Proprietary Optics

Whole-well images are captured moving the plate once per well.

Illumination

Flat illumination and excellent edge-to-edge contrast images every cell in every well.

Image Segmentation

Bright field and fluorescence algorithms for accurate segmentation of adherent and suspension cells.

Whole-Well, High Resolution Images Acquired at High Speed

1. Image

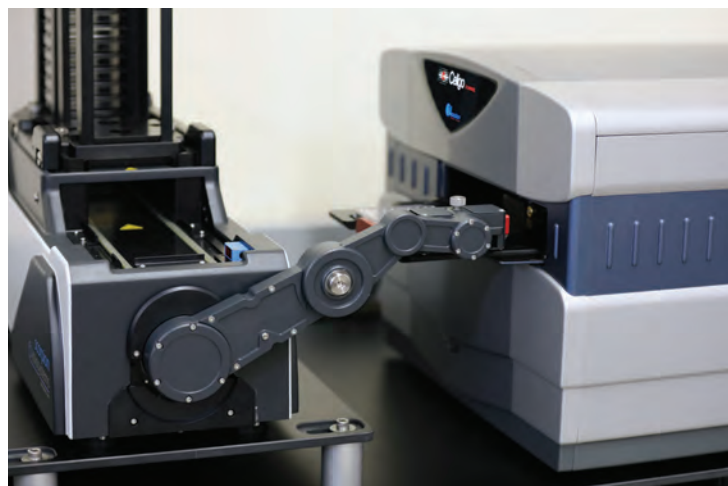

- Proprietary optical design enables uniform illumination and consistent edge contrast
- Image and count every cell in each well: 0 - 100,000 cells/96-well
- 5 imaging channels with bright field and 4 fluorescent channels

2. Analyze

- Fast scanning for image acquisition and analysis with minimal plate movement ensuring minimal sample disruption
- Accurately quantify cells and colonies with a non-invasive method
- Measure adherent cells without trypsinization

3. Results

- Save experiment settings – quickly run the same assay on many plates without additional set up
- System automatically stitches multiple fields of view into a single full resolution image

Celigo easily integrates with robotic arms, plate stackers, automated incubators and liquid handlers.

Integrated Cell Imaging and Analysis in the Same Software

Oncology

- Apoptosis
- Cell cycle
- Cell viability
- DNA synthesis
- Cytotoxicity
- Cell migration
- Cell morphology
- Immunophenotyping
- Metabolism
- Wound healing
- Chemotaxis

Immuno-Oncology

- Direct cell-mediated cytotoxicity
- Antibody-dependent cell-mediated cytotoxicity (ADCC)
- Complement-dependent cytotoxicity
- Antibody-mediated cytotoxicity

3D Tumor Spheroid Modeling

- Growth tracking
- Growth inhibition
- Apoptosis / Viability
- Invasion / Migration
- Patient derived organoids (PDOs)

Stem Cell Research

- iPS cell line generation
- Embryoid body morphology
- Stem cell marker analysis

Virology Assays

- Foci and plaque counting
- Antibody neutralization
- Hemagglutination assay

Cell Line Development and Biologics Production

- Single cell detection
- Transfection / Transduction efficiency
- CRISPR gene editing monitoring
- Single cell to single colony monitoring
- Growth tracking
- Cell secretion
- Hybridoma screening
- Routine quality control

Cells counted to the well edge

Propidium iodide and Hoechst stained 3D spheroid

Surface marker stained iPS cells

Accurate & Consistent Cell-Mediated Cytotoxicity Assay for Immuno-Oncology

The Celigo images and counts cells directly within the experimental environment, while other methods often require the removal of cells from the experimental plate to perform end point assays. Improve your data by performing consistent and accurate direct cell counts. Immuno-Oncology (I-O) assays additionally benefit from Celigo's increased sensitivity since cell death is measured at the individual cell level. Consequently, fewer target and effector cells are required, allowing for effective use of precious primary cell samples to generate the most number of data points. Typically, only a few minutes are required for imaging and analyzing a 96- or 384-well plate

✓ Quantify Killing & Visualize Formation of Immune Complexes: Direct Cell Counting Assay in a 96-Well Plate

Count every cell in every well

Acquire whole-well, high resolution images (in bright field and fluorescent) and count every cell in every well.

Auto-save hi-res images

Celigo images are used to verify results and are automatically saved for all wells.

Kinetic measurement of tumor cell killing

Images from the same 96-well plate (shown left) were acquired at 0 hours and 6 hours during a non-destructive, kinetic assay using calcein AM. Celigo images verify the decrease of calcein positive live tumor cells from 11,381 to 1,635 within the same well.

“ The Celigo has allowed our department to standardize and centralize the work within the institution.

Antibody-Dependent Cell-Mediated Cytotoxicity (ADCC) Assays

NK cell mediated cytotoxicity effects on targeted cells

Count live calcein AM positive cells to determine the effect of a bimodal fusion protein (M7824) on NK cell-mediated cytotoxicity in co-cultures.

Target cells (A549) were pretreated with TGF- β 1 and IFN- γ and stained with calcein AM (CAM). The NK cells were isolated from PBMCs and co-cultured with the A549 cells.

- Image cytotoxicity in co-cultures
- Determine the percent specific lysis

Oncoimmunology 2017, 6(10):e1349589

Fluorescent and bright field images of A549 treated with M7824 proteins. After 16 hours of co-culture with NK cells, propidium iodide (PI) was added, and live cells (CAM+/PI-) target cells were counted.

Specific Lysis (%): Pre-treatment with TGF- β 1 and IFN- γ sensitized A549 target cells to ADCC by M7824.

Tracking Bispecific Antibody Induced Cytotoxicity in Complex Co-Culture

Multi-valent antibody analysis (DuetMab Assay)

The Celigo was used to directly count co-culture of prenatal cells and HER2 KO cells stained with CellTracker™ Green and Violet, respectively.

The assay investigated the selective cytotoxicity effect of the monovalent bispecific IgG (DuetMab) on a co-culture of prenatal cells and HER2 KO cells.

Fluorescent images of time 0 and 72 hours of prenatal and HER2 KO cells incubated with DuetMabs.

Cell viabilities were calculated by direct cell counting, which showed differences in DuetMabs dose response between the Prenatal and HER2 KO cell types (IC₅₀: 1.08 nM and 10.71 nM, respectively).

Discover Combination Therapies

Investigate Mechanisms of Drug Resistance, Signaling Pathways

Fast and high throughput cell counting assays are needed for drug discovery to satisfy the need to test an increasingly large number of cell models with large numbers of compounds and compound combinations. Gene editing technologies, such as CRISPR/Cas9, are rapidly expanding phenotypic *in vitro* cell models for oncology, and the success of immune and combination therapies has increased the number of compounds to be tested.

- Count and analyze cells directly in experimental plates
- Up to 5 imaging channels (e.g. BF, Far Red, Red, Green, Blue)
- Whole- well imaging for more accurate analysis
- Direct high-throughput counting of suspension and adherent cells

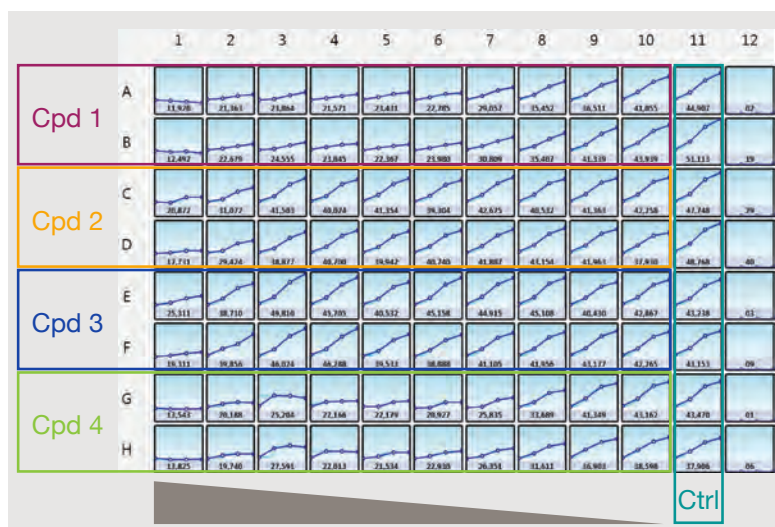

Citation:
 Fu X, et al. *Breast Cancer Res.* 2014 Sep 11;16(5):430
 Giuliano M, et al. *Clin Cancer Res.* 2015 Sep 1;21(17):3995-4003

Label-Free Kinetic Cytotoxicity Assays

Multi-drug growth inhibition

- 96-well plate set-up with 4 compounds at 10 concentrations and a control
- Scans the plates at multiple time points over hours or days
- Automatic growth curve generation for each well

“ We utilize the high throughput aspect of the Celigo. Instead of only having 3 data points you get 96 data points. You can look at small changes and actually get some statistical significance out of it.

✓ Automatically Quantify 2D Migration / Invasion Assays

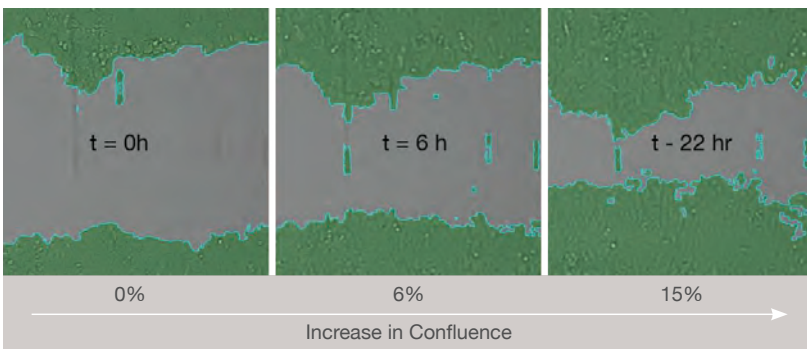

Image and quantify transwell-based chemotaxis, invasion and migration of suspension and adherent cells.

Suspension cells located inside the insert (A) migrate through the porous membrane toward the chemoattractant in the bottom of the plate.

Adherent cells located on the top of an ECM coated insert (C) invade and migrate to the bottom side of the membrane insert.

Celigo automatically images and counts the migrated suspension and adherent cells (B, D).

Wound Healing Assays: Image and Quantify

Image the entire well at multiple time points.

Software automatically, and concurrently with imaging, calculates the cell confluence in each well.

✓ Monitor Growth Inhibition Using Direct Cell Counting

Dose-Dependent Growth Inhibition

Generated images (shown left) are from two wells, B2 and B10, post drug treatment at doses of 33.3 μM and 0.005 μM respectively.

- Visual determination of Growth inhibition (greater in B2 than B10).
- Individually identify and segment cells (green) for each drug treatment.

Image Cytometry Enabling High-Throughput 3D Tumor Spheroid Screening

3D tumor spheroid is a highly complex model increasingly used for cancer drug screening assays due to their better physiological relevance. Unlike 2D models, where cells can be enumerated and analyzed individually, the 3D model, which consist of clustered cells, requires a more advanced analysis method to characterize and quantify the effect of drugs on the entire spheroid. Therefore, to create a multi-parametric analysis platform, various orthogonal assays are required to screen the drug compounds. Celigo's high-throughput imaging and analysis is achieved by acquiring a single image from a single focal plane per well, which allows rapid screening of 96- and 384-well plates, typically in less than 2 minutes.

Growth Inhibition Studies in Microwell Plates

1. Form and Treat 3D Tumor Spheroids

Four days after seeding, spheroids were treated with compounds for 72 hours in u-bottom ultra low attachment 96-well plates.

2. Analyze 3D Tumor Spheroids

Acquire and analyze whole-well images at multiple days after adding drug compounds.

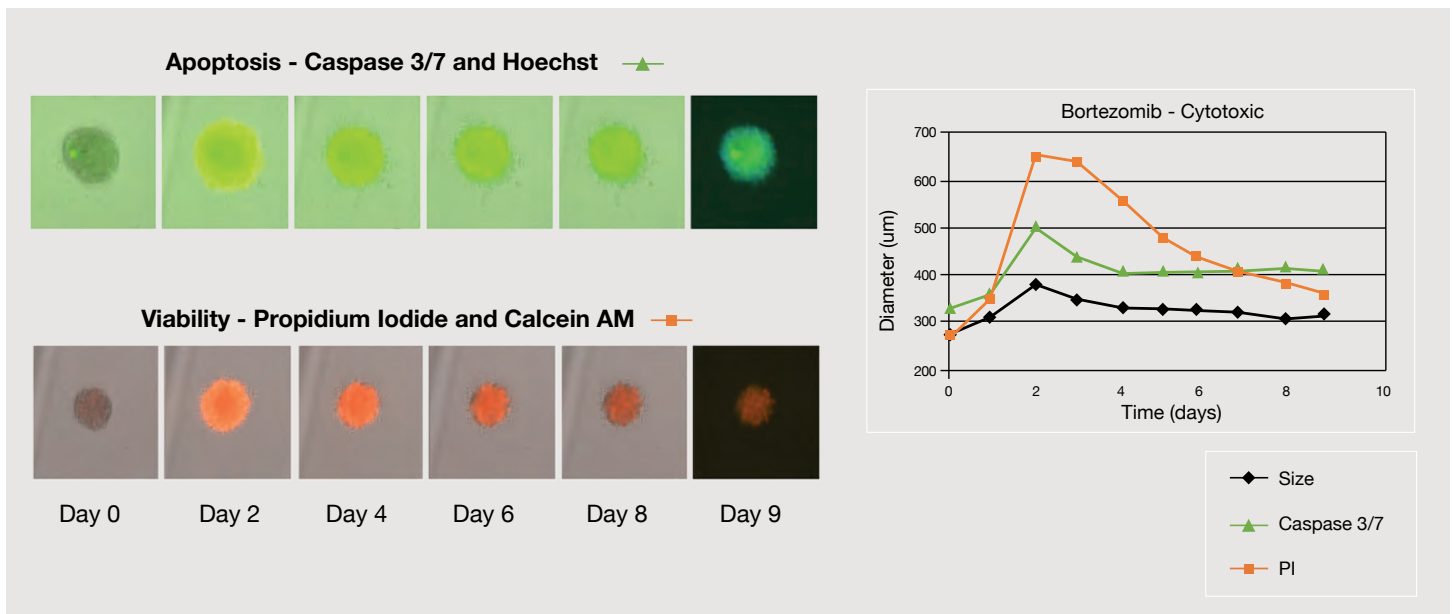

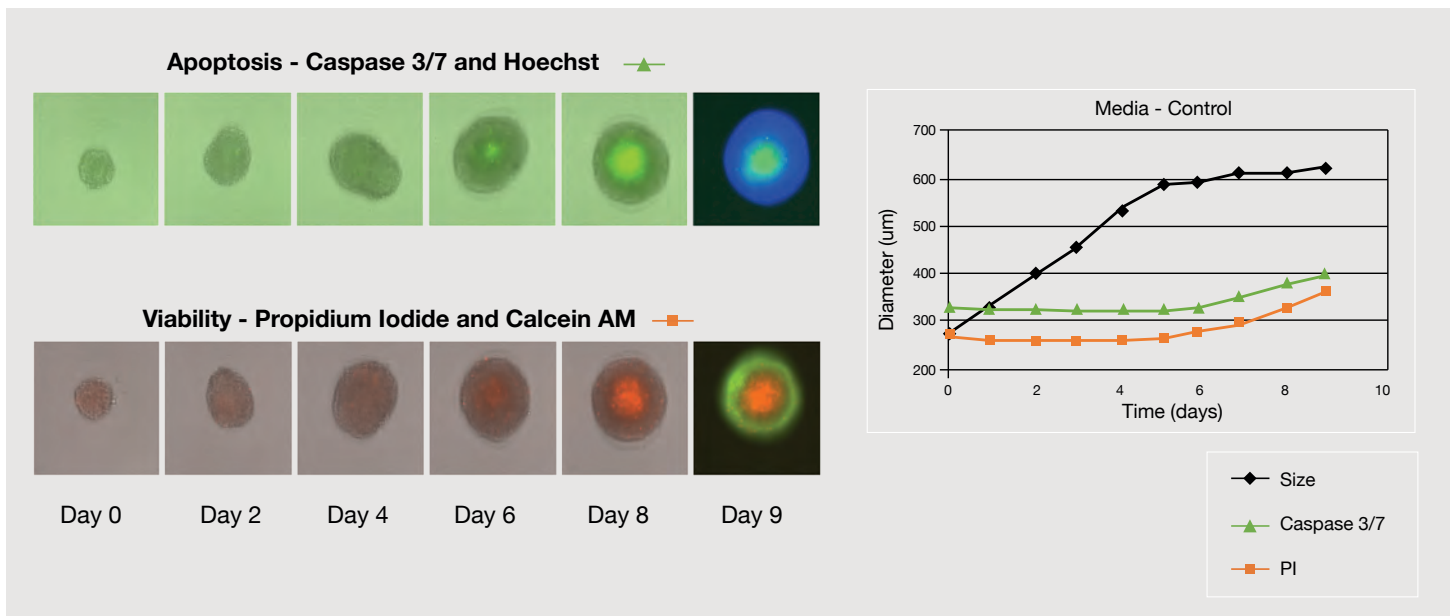

Tumor sphere diameter under different drug treatments is exported into excel for further data analysis.

“ The Celigo is a great instrument for fluorescent tumor sphere counting and even fluorescent colony counting. I would recommend it! - Northwestern University

Real-Time Kinetic Apoptosis and Viability Screening

Measure the effects on apoptosis and viability with fluorescent image analysis

Tumor spheroids were treated with different drug compounds and screened to measure the effects on apoptosis and viability. The drug effects are characterized by measuring caspase 3/7 and Propidium iodide (PI) fluorescent intensities over time.

✓ Tumor Spheroid Drug Screening

Visualize drug compound screening

Analyze spheroid growth, viability (calcein AM/PI), apoptosis (Caspase 3-7/ Hoechst) and invasion.

Bright field and fluorescent images acquired by the Celigo visually confirm the state of the spheroid under different drug treatments.

Drug screening data analysis

Data generated from image analysis: Compound 3 and 4 were highly cytotoxic to the spheroids, while compound 5 and 12 showed cytostatic effects.

“ The Celigo is our “go to” for low resolution, high speed scans, particularly when working with spheroid biology. - NIH NCATS

✓ Growth Tracking and Viability of Organoids

3D organoid analysis

Organoids are a 3D *in vitro* culture system derived from self-organizing stem cells. They can recapitulate the *in vivo* architecture, functionality, and genetic signature of original tissues and are thought to be a relevant model for evaluating drug effects.

In the examples shown here, green segmentation is added to bright field images for quick and easy identification of Celigo counted organoids.

Viability determination

Addition of non-perturbing dyes like Propidium iodide (PI) generates valuable viability data, as seen in these whole-well images.

Perform organoid analysis in 24- to 384-well plates

Whole-well imaging for organoid screening can be done in 24-well plates down to 384-well plates.

Quantify and Monitor Cell Line Development Mediated by CRISPR/Cas9 System

Chinese hamster ovary (CHO) cells are widely used as cell factories for the production of biologics. Gene editing technologies are used to alter function and to enhance production. During gene editing optimization and monitoring of stable clones, Celigo whole-well imaging allows for:

- Direct cell counting and quantification of transfection/transduction efficiencies
- Rapid high-throughput imaging platform
- Direct documentation and verification of single cell to a single colony

Monitor Cell Health and Expansion During Cell Line Development

Quantify transfection efficiencies*

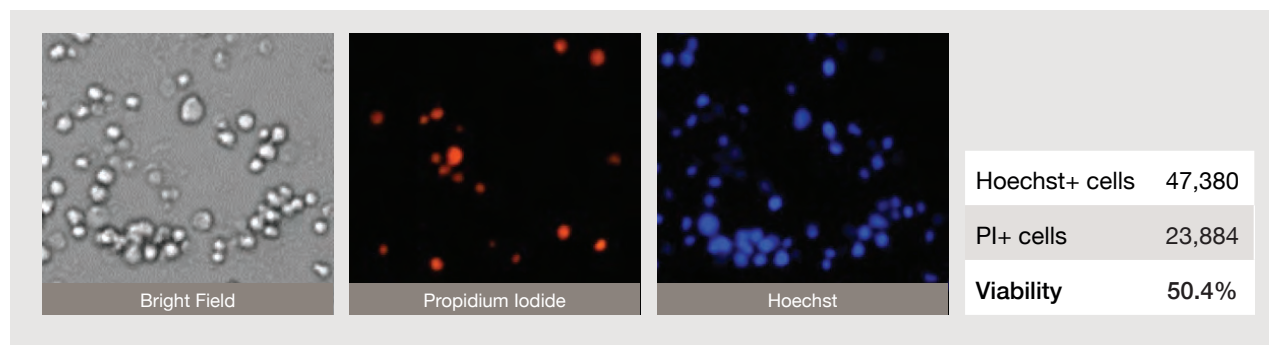

Whole-well imaging combined with the 2D gating interface, allows high-throughput testing of transfection constructs and as a quality control measure during expansion to verify cell line stability.

Monitor single cell to single colony formation†

Generated colonies are imaged and analyzed for colony number, size, shape and expression of a fluorescent marker indicative of a successful transfection.

Monitor cell expansion during batch culturing‡

During culture expansion, cell growth and viability were measured using a bright field and multi-channel fluorescent assay. (Images below BF = total cells, PI = dead cells, Hoechst = live cells)

“ The Celigo is really multifunctional – it can do an awful lot. If you want to track growth rates, it will do it perfectly. If you want to do large analysis, like [embryoid bodies], it will be perfect.

✓ Monitor Tumor Sphere Formation in Microwell Plates: Single Cell to a Single Sphere

Single cell to single tumor sphere

Use whole-well imaging to confirm a single cell per well (shown on Day 0) and verify its formation into a single tumor sphere (shown on Day 15).

Quantification of tumor sphere size

Each tumor sphere (shown at right) grew from a single cell clone seeded on day 1.

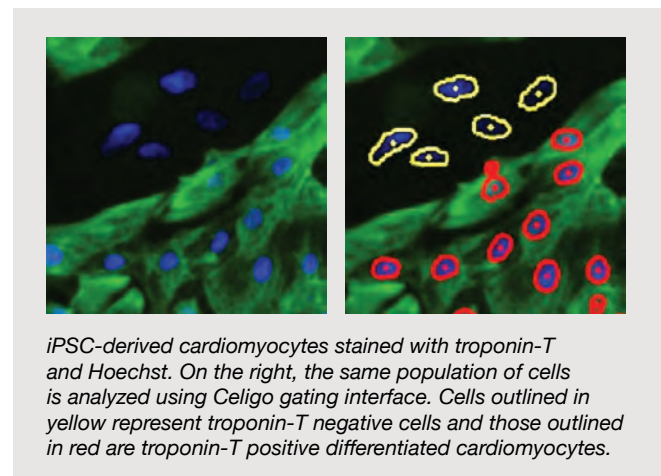

- Images show the variation in formed tumor sphere size and morphology.
- Generate a size distribution graph showing the variation of tumor sphere sizes.

✓ Automated, High-Throughput, Characterization and Differentiation of Induced Pluripotent Stem Cells

Celigo image cytometer is utilized during the multi-stage process of iPSC generation.

- Bright field confluence and fluorescent viability assays.
- Track fibroblast growth, monitor cell expansion during pre and post freeze/thaw cycles.
- Image iPSC colonies using fluorescent fixed and live-cell markers for monitoring the re-programming process.
- Examine differentiation by imaging and quantifying embryoid bodies and cell-line specific markers

Analysis of Viral-Based Assays for Vaccine, Therapy and Disease Research: Automation, High Throughput and Multi-Parameters

The Celigo imaging cytometer is an essential technology for the standardization and optimization of viral based assays. With rapid image acquisition and data analysis, viral plaque, antibody neutralization, and multiplexed high-throughput assays are achieved in minutes. Also, enhanced sensitivity, for measuring viral titers of low-level infections is achieved through direct cell counts of whole-well images. The versatility of the Celigo instrument provides fast, efficient and reliable results for your virology research.

✓ Large Dynamic Range for Viral Titers Via Direct Cell Counting

Figure 1A

Figure 1B

Count every infected cell to determine the viral titer

HEK293T cell seeded at 80 % confluence and infected with a 10-fold serial dilution of GFP-labeled lentivirus. Post infection, cells were imaged on the Celigo (outlined in red; Figure 1A), and the fluorescent cell count for each well was used to generate a viral titer curve (see Figure 1B)

“ Every night we're scanning between 50-100 plates. You can't look at 50-100 plates by eye, so we just come in and review the scans and data each morning. The Celigo makes everyone more efficient.

✓ Increase Throughput by Automating Plaque Imaging and Analysis

Figure 2A.

Count bright field, fluorescent and stained viral plaques

Image and analyze plaques from cytolitic and non-cytopathic viruses: areas of infection in confluent cell culture indicated by horseradish peroxidase (HRP) for non-cytopathic viruses (figure 2A) and zones of clearing for cytolitic viruses (figure 2B).

Early viral infections can be seen by detecting zones of viral infection (plaques) by detecting the GFP signal within the infected cells (Figure 2C).

Figure 2B.

Figure 2C.

✓ Perform Real-Time and End Point Monitoring of Viral Infections

Figure 3A.

Figure 3B.

Monitor the influenza virus infection

Influenza infected cells were fixed, stained and imaged (Figure 3A and 3B). The software identifies and enumerates the number of infected cells (Figure 3D), as well as total number of cells (Figure 3C).

- Whole-well imaging allows for the identification of infected cells even at low viral titers.

Figure 3C.

Figure 3D.

Celigo Platform Highlights

Celigo's modular design allows you to customize for your laboratory's needs. With the integration of modular systems, specific to your research application need, automated microplate handling for either kinetic end-point analysis or time-point analysis, as well as, complimenting reagent kits, Celigo can improve your lab's work-flow and increase its capabilities.

Hardware Offerings

- Celigo BF Only
- Celigo 4 Channel
- Celigo 5 Channel

Software 5.0 with Project Mode. Easy as 1-2-3!

1. Select project file

2. Load prepared plate & click run

Acquisition, analysis, and data export steps are done automatically

3. Get Results

- Report Templates: present data in customer defined layouts
- Multiple FCS Express file export options
- FCS and ICE file formats
- Single file per plate or individual files per well
- With images or without images in ICE file
- Compression option
- Auto open in templates
- Security and Logging add-ons in FCS Express

“ It's relatively simple to use – it's self-explaining actually, reliable, and the images you get out of it are really nice, underlining your results and you can make nice presentations with the Celigo images.

Stacker Automation

- Up to 50 plate capacity
- 15 sec transfer rate between plates
- Set up experiment and run
- Data exports automatically for each plate
- Handles plates with or without lids
- 6-well up to 1536-well plate formats
- Fits on standard lab bench
- Ideal for endpoint assays
- Easy to add on to existing Celigo instruments

Celigo Specific Reagents

- Formulations designed for Celigo
- Project files associated for each reagent kit

Stacker Specifications

| Parameter | Specification | |
|---|---|---|
| Celigo only Dimensions | 19 inch wide x 29 inch long x 17 inch high (with plate holder extended) | |
| Celigo +Stacker Dimensions | 25 inch wide x 44 inch long x 40 inch high (Total) | |
| Electrical Power | 5 Electrical outlets needed at 100-240VAC 50/60Hz (30Amps Total) | |
| Compressor (sold with Stacker) | 1.2 CFM @ 90 PSI with 1 gallon tank | |
| Operating Temperature | 15 °C to 25 °C | |
| Operating Humidity | 10% to 90% RH, non-condensing | |
| Instrument Shipping & Storage Temperature | -18 °C to 65 °C | |
| Instrument Shipping & Storage Humidity | 10% to 90% RH, non-condensing | |
| Manufacturer | Nexcelom Bioscience, LLC. 360 Merrimack St., Building 9 Lawrence, MA 01843 SS143HS | Kbiosystems Limited Units 5 to 10 Paycocke Close Basildon, Essex, UK, |
| Distributor/Support | Obtain information at http://www.nexcelom.com/purchase or contact support@nexcelom.com | |

Reagents

ViaStain™ Viability Reagents

- Perform in-plate staining and analysis of suspension and adherent cells
- Measure percent viability and number live/dead cells

| Name | Catalog # |
|---|-------------|
| AO / PI Staining Solution | CS2-0106 |
| Calcein AM | CS1-0119 |
| Calcein-AM / PI Cell Viability Kit | CSK-0118 |
| Calcein AM / PI / Hoechst Viability Kit | CSK-V0006-1 |
| Hoechst/PI Viability Kit | CSK-V0005-1 |

ViaStain™ Apoptosis Reagents

- Measuring programmed cell death using various apoptosis detecting reagents: Annexin V, Caspase 3/7-Live cell, Caspase 3 and Caspase 8
- Use Caspase 3/7 reagents for 2D and 3D cultures

| Name | Catalog # |
|---|-------------|
| Live Caspase 3/7 Detection for 2D/3D Culture | CS1-V0002-1 |
| Live Caspase 3/7 Detection for 2D/3D Culture with Hoechst | CSK-V0003-1 |
| Annexin V-FITC | CS1-0114 |

ViaStain™ Proliferation/Tracer Reagents

- Fluorescent proliferation and cell-labeling dyes for cell identification, cell tracking and co-culture experiments

| Name | Catalog # |
|-------------|-------------|
| CMFDA | CS1-P0001-1 |
| CFSE | CS1-P0002-1 |
| Tracer Blue | CS1-P0003-1 |
| Calcein AM | CS1-0119 |

See our website for a complete listing of reagents at www.nexcelom.com/products/nexcelom-reagents or contact customer support.

Lawrence, MA 01843, USA

“ We have one Celigo, completely integrated, and we have 5 people using it consistently. But more and more people outside our team are approaching us to use the Celigo. We've made it popular within the company. People are starting to realize the advantages of the robust system, and of what they can get out of it.
